

Hands-On Workshop: Designing a Prompt-Driven Agent

IS 365 - 10/15/2025

What You'll Be Doing

1. Pick a **role** and **define its goal**
 2. Choose a **knowledge source**
 3. **Write + Refine** prompts (At least 3 iterations)
 4. **Observe** outputs, **reflect**, and **iterate**
 5. **Connect** your design to a real business process
- 
- 

Activity 1 - Define the Role & Task

- **Persona** - Who is your assistant?
- **Task** - What outcome is it responsible for?
- Examples:
 - Customer Support Analyst → summarize ticket trends
 - Recruiting Assistant → screen candidate bios
 - Customer Experience Analyst → identify themes in reviews

Activity 2 - Choose a Grounding Document

- Use a realistic data source or short reference text
 - \approx 1-2 pages
- Can be: reviews, reports, meeting notes, survey results, etc.

Activity 3 - Prompt Engineering & Iteration

1. Iteration 1 – Task: Start with a basic instruction
2. Iterations 2 & 3 – Refine: Add 2–3 elements of your choice
 - a. Context • Example • Persona • Format • Tone
3. After each iteration:
 - a. Reflect: What worked? What didn't? What would you change?
 - b. Keep track of your prompts + responses

Things to Think About

- How would your assistant fit into a real workflow?
 - What would trigger it, and what output is it producing?
- As you work through prompting:
 - How does structure and tone affect performance?
 - Where does it struggle or surprise you?
 - What would you improve next?

Activity 4 - Submission & Wrapping Things Up

- Complete all three prompt iterations
- Discuss with your group throughout the process
- You'll submit an **elevator pitch** for your AI assistant at the end of class
 - What does your assistant do?
 - Why is it useful or innovative?
 - How could it improve a real business process?
